SUMMARY

BACKGROUND & RESEARCH OBJECTIVES

In Thailand, transgender women are biological males who act, feel, think and look like females. Thai society is generally more accepting of transgenders than in the norm in other countries, and the majority of transgenders openly live their lives as 'women'. Some transgender women however face discrimination and stigma within their families or working life, with a significant population of this population of transgender women being involved in commercial sex work¹. The situation of stigma and discrimination in the lives of transgender women in Pattaya is strongly linked to their vulnerability to HIV. For instance, violence and threats of violence may limit the ability to negotiate safe sexual behaviors, and then may also increase the chance of non-protective sex.² Transgenders are not allowed to enter some hotels in Pattaya. Most of them live separately from their families, although, in most cases, their close family members will be aware that they are living as a transgender. In the past, carrying condoms while looking for client along the street made them afraid of getting arrested, although this is no longer a major concern for most transgender women in the study area.

Previous studies conducted by PSI have indicated multiple sex partners and inconsistent condom use during sex among transgender women. There is a high prevalence of HIV risk behavior and it is suspected that HIV rates are higher among transgender women than among the more general MSM population in Thailand. HIV prevalence among transgender women (TG) in Chonburi is 8.85 percent.³

The purpose of the Tracking Results Continuously (TRaC) survey among Transgenders (TG) is to provide evidence for monitoring and implementation of PSI/Thailand's HIV prevention program. Information from this study will be used to develop behavior change communication interventions for HIV prevention including branding, key messages, and/or campaigns for condom use, lubricant use, HCT and STI testing

This study design is for the baseline of the TRaC Survey. This survey aims to answer two fundamental questions related to segmentation and monitoring of populations.

1. Segmentation. By each risk/behavior combination or factors which opportunity, ability and motivation (OAM) constructs and population characteristics are significantly correlated with condom use?
2. Monitoring. What are the levels and trends that are evident in other key behavior, risk, OAM constructs, and exposure to PSI/Thailand activities?

DESCRIPTION OF INTERVENTION

PSI/Thailand is implementing a program "Sisters", the Targeted Behavior Change Communication (BCC) Program for HIV/AIDS Prevention among Transgender Population in Pattaya, Chonburi Province, Thailand. Programmatic focus is placed on behaviors and high transmission sites, or "hot spots" that are identified as the principal drivers of HIV in Thailand.

¹ Thailand (2009): HIV/AIDS TRaC among Transgenders, Third Round

² The operational research on developing healthcare and social service system for TG and MSW in Pattaya affected by manifestations of stigma and discrimination, including gender-based violence, Policy Research and Development Institute Foundation.

³ IBBS, Chonburi Provincial Public Health Office, 2010

The purpose of the program is to promote safer sex among TG through peer education and drop in center activities in Pattaya (Sisters), and using a high coverage social marketing (SM) strategy to increase access to and availability of condom and water-based lubricant. Peer education activities will expand to Sattahip and Sriracha District in Chonburi Province. Activities in the drop in center include designing and implementing culturally appropriate behavior change programs through interpersonal communication, ensuring access to high-quality voluntary counseling and testing services, developing the capacity of most at risk populations to lead prevention activities, creating safe spaces for most at risk populations, enhancing access to essential care and treatment services for HIV/AIDS, monitoring and evaluation of all activities and documenting lesson learned. Outreach activities through peer educators that conducted at TG hot zones and their living places such as pubs, bars, apartments, the beach, and parks. Interpersonal communication for TG includes HIV/AIDS knowledge and safe sex.

METHODOLOGY

This study was a first round cross-sectional survey among TGsin Pattaya, Sattahip and Sriracha. This study was conducted in December 2011. The study population for this TRaC were TGs in Pattaya, Sattahip and Sriracha, aged 18-35. In order to be included in the study, TGs must have: 1) self-identified as transgender and said that they feel sexually attracted to males; 2) had more than one sexual partner (either same or different type of partner) and had penetrative sex with these partners within the past three months; 3) been living in specific area for more than one month. Time-location sampling (TLS) was used to recruit this hard-to-reach group. A structured questionnaire was used to collect data. A total of 308, 31 and 47 interviews were completed for Pattaya, Sattahip and Sriracha respectively. In total, 386 TGs were recruited in this study. Analyses consisted of logistic regression and unianovas to examine ascertain which determinants are correlated with key behaviors. Coarsened Exact Matching (CEM) was used to match treated individuals with those in a control group, based on specific covariates. The effect of treatment on outcome is the difference between treated and non-treated group.

MAIN FINDINGS

This study focused on four key behaviors; condom use, lubricant use, VCT and STI screening. The monitoring table highlights that:

- ∴ TG reported high percentage of condom use at last sex. Consistent condom used with all type of partner was lower than condom use at last sex. Condom use behaviour varies by partner type. With commercial partner and regular commercial partner, TG reported more consistent condom use than with casual and regular partner. Consistent condom use with regular partner in the past 3 months was only 57.8%.
- ∴ Water-based lubricant used showed the same trend as condom used. Consistent condom used along with water-based lubricant with casual and regular partner was 58.1% and 43.1% respectively. 17.6% of TGs reported using oil-based lubricant in the past 3 months.
- ∴ Two-thirds of TG (66.6%) reported ever having been tested for HIV, while 50.3% of them received the test in the past 6 months and only 10.9% reported received three components of VCT.

The results of segmentation analysis indicate that the probability of TG using condom consistently in the past 3 months with each type of partner;

With commercial partner;

- ⌘ *Availability of condoms.* Around 14.2% of those practicing unsafe sex report that a condom is not available at the place they have sex (OR=0.64, $p<.001$).
- ⌘ *Attitude about using condoms.* TG who agree that if they get more money it is OK to not use a condom were less likely to use condoms consistently with commercial partners (OR=0.67, $p<.001$).
- ⌘ *Intention to use condoms.* TG who intend to not have sex without a condom were more likely to use condom than those who did not intend (OR=1.46, $p<.01$).
- ⌘ *Self efficacy.* TG who were afraid of losing clients if they insist on using condoms were less likely to use condoms consistently with commercial partners (OR=0.79, $p<.05$).

With casual partner;

- ⌘ *Availability of condoms.* TG who reported consistent condom use with casual partner in the past 3 months (73.3%) were more likely to state that they kept a condom with them when going out to meet their partner (OR=1.52, $p<.05$).

With regular partner;

- ⌘ *Attitude about using condoms.* TG who reported consistent condom use with regular partners were more likely to agree that condom use represents love and trust with regular partner (OR=2.02, $p<.01$).

The results of CEM evaluation analysis reveal TG who receive any service from Sisters in the past 12 months is associated with:

- ⌘ HIV tested in the past 6 months (OR=2.61, $p<.01$).

PROGRAMMATIC RECOMMENDATIONS

- ⌘ The program faced a challenging environment to work with TG in Pattaya due to large turnover of TG, with around half of them having been resident for 1 year or less. Effort should be put on reaching new TG in the area and keep contact with TG who move to other areas.
- ⌘ Pattaya based TG are earning a lot more money than those in Sattihip and Sriracha through having a higher number of commercial sex customers. Most TG in Sriracha (55%) work as employees in a factory. Due to different context in these areas suggest for customization of program intervention.
- ⌘ 58% of TG had only commercial partners while 24% of them had more than one type of partners in the past three months. The program was very successful in promoting condom use. Consistent condom use with those who had only commercial partner was 86% while consistent condom use with TG who had more than one type of partners was lower. These suggest program messages to focus on promoting consistent condom use with all types of partners with every sexual contact, not only with commercial partners.
- ⌘ 87% of TGs reported consistent condom use with regular commercial partners. However, 4% of them reported never using a condom when having sex with regular commercial partners. Therefore, this suggests that they are a high risk group. Key message should be focused on promoting consistent condom use even with regular commercial partners.

- ∴ Condom use key messages should be focused on the value of using condoms over receiving more money, self confidence to insist on not having sex without a condom, keeping condoms with them all the time and that condoms represent love and trust.
- ∴ The program was successful in promoting not using oil-based lubricant with TG in Pattaya, therefore, existing program intervention should continue for TG in Sattahip and Sriracha.
- ∴ 32% of TG reported never having been tested for HIV. Among those who ever received a test, 10% have not been tested in the past 12 months. The program was effective in promoting HIV testing. TG that have had contact with Sisters have over 2.6 times the likelihood of having been tested for HIV in the past 6 months. TG who had ever tested reported intention to get it in the next 6 months, while those who never received a test reported being afraid of their test result. Therefore, efforts should be put on coping with their fear to get their first test and then they will be more likely to get their test regularly.

The above recommendations will be implemented through the Sisters program's main activities: development and distribution of IEC materials; interpersonal communication through outreach and counseling; group edutainment activities; and influencing peer norms through training of popular opinion leaders.

MONITORING TABLE

Trends in behaviors, OAM behavior factors and exposure among TGs in Pattaya, Sattahip and Sriracha, 2011

Risk: Transgenders, 18-35 years old in Pattaya, Sattahip and Sriracha

Behavior: Condom used at last sex, consistent condom used, water-based lubricant used at last sex, HIV test and STI test

INDICATORS	Dec 2011 N=386
BEHAVIOR/USE	
Condom use	%
- Condom used with commercial partner at last sex ¹	95.1
- Condom used with regular commercial partner at last sex ²	94.0
- Condom used with casual partner at last sex ³	86.7
- Condom used with regular partner at last sex ⁴	61.8
- Consistent condom used with commercial partner ¹	85.8
- Consistent condom used with regular commercial partner ²	86.7
- Consistent condom used with casual partner ³	73.3
- Consistent condom used with regular partner ⁴	57.8
Water-based lubricant use	%
- Water-based lubricant used with commercial partner at last sex ¹	91.6
- Water-based lubricant used with regular commercial partner at last sex ²	91.6
- Water-based lubricant used with casual partner at last sex ³	74.3
- Water-based lubricant used with regular partner at last sex ⁴	71.6
- Consistent water-based lubricant used with commercial partner ¹	81.2
- Consistent water-based lubricant used with regular commercial partner ²	85.5
- Consistent water-based lubricant used with casual partner ³	63.8
- Consistent water-based lubricant used with regular partner ⁴	62.7
Condom use along with water-based lubricant	%
- Condom used along with water-based lubricant with commercial partner at last sex ¹	89.6
- Condom used along with water-based lubricant with regular commercial partner at last sex ²	89.2
- Condom used along with water-based lubricant with casual partner at last sex ³	71.4
- Condom used along with water-based lubricant with regular partner at last sex ⁴	50.0
- Consistent condom used along with water-based lubricant with commercial partner ¹	75.4
- Consistent condom used along with water-based lubricant with regular commercial partner ²	81.3
- Consistent condom used along with water-based lubricant with casual partner ³	58.1
- Consistent condom used along with water-based lubricant with regular partner ⁴	43.1
Oil-based lubricant used	%
- Oil-based lubricant used in the past 3 months	17.6
Unsafe sex while drunk or high on drug	%
- Had sex without condom while drunk or high on drug in the past 3 months ⁵	24.4
VCT and HIV test	%
- Ever been tested for HIV	66.6
- Received HIV test in the past 6 months	50.3
- Received VCT in the past 6 months	10.9
STI test	%
- Received STI test in the past 12 months ⁶	37.5
OPPORTUNITY	
Availability	Mean
- Sometime, condom is not available at the place where I have sex	2.64
- I keep a condom with me when I go out to meet my partner	5.39
ABILITY	

INDICATORS	Dec 2011 N=386
Self Efficacy	Mean
- I am afraid of losing my clients if I insist on using a condom	2.66
MOTIVATION	
Attitude	Mean
- If I get more money, it is OK to not use a condom	2.05
- I am less likely to use condoms with a regular commercial partner	1.89
- Condom use with regular partner represents love and trust (SCALE) ⁴	4.46
Intention	Mean
- I intend to not having sex without condom	4.56
- I intend to get HIV testing and counseling in the next 6 months	4.91
Outcome Expectation	Mean
- Using condom reduces sexual pleasure	3.32
Threat	Mean
- I am fear of the test result so I don't want to get HIV test	2.98
EXPOSURE	%
- Awareness of Sisters	80.1
- Visited Sisters drop-in center in the past 12 months	33.7
- Has been contacted by Sisters outreach in past 12 months	62.7

Note:

- | | |
|---|---------|
| 1 Among those having commercial partner | n = 309 |
| 2 Among those having regular commercial partner | n = 166 |
| 3 Among those having casual partner | n = 105 |
| 4 Among those having regular partner | n = 102 |
| 5 Among those having sex while drunk on alcohol or on drug | n = 213 |
| 6 Among those reporting that had STI symptoms in the past 12 months | n = 24 |

OAM determinant values ranged from 1-6 "1=Strongly Disagree, 2=Disagree, 3=Mildly Disagree, 4= Mildly Agree, 5=Agree, 6=Strongly Agree"

Attitude (Scaled Items)

Condom use with regular partner represents love and trust

- 1) I love my boyfriend so I have to protect him by using condom every time
- 2) Using condom is appropriate for people who love each other
- 3) Using condom is appropriate for people who trust each other
- 4) My regular partner still think that I trust him if I suggested using a condom
- 5) My regular partner still think that I love him if I propose usinga condom

Matching Summary:

- + Matching variables were selected by choosing factors that affect participation in the program. For TG in Pattaya, Sattahip and Sriracha, if they live in Pattaya, longer period of staying in the area, work in hot zone where easier meet outreach team and have higher number of TG friends will make them more likely to participate in the program.

Matching Summary:

+ Matching variables were selected by choosing factors that affect participation in the program. For TGs in Pattaya, Sattahip and Sriracha, if they live in Pattaya, longer period of staying in the area, work in hot zone where easier meet outreach team and have higher number of TGs friends will make them more chance to participate in the peogram.

Multivariate L1 distance: 5.031e-17

Number of matched cases: 302 cases

Visited Sisters Drop-in Center in the past 12 months

Yes 123 cases

No 179 cases

CEM adjusted for HIV test: 58.61%

Correlation coefficient: 0.1904 (p-value = 0.009)

Control variable: Salary, education, number of partners, have regular partner

Remark:

Exposure variable 'Has been contacted by outreach in the past 12 months' was tested with HIV test in the past 6 months but it was found not significant different between those who exposed and non-exposed to the intervention.

ANNEX

ANNEX A: Methodology

This study was funded by the United States Agency for International Development. This study was a first round cross-sectional survey among TG in Pattaya, Sattahip and Sriracha. Cross-sectional study is a descriptive study in which disease and exposure status is measured simultaneously in this population. Cross-sectional studies can be thought of as providing a snapshot of the frequency and characteristics of a disease in a population at a particular point in time.⁴

This study was conducted in December 2011. Respondents were recruited by trained interviewers at time and location specify. The interview took around 1 hour.

1. SUBJECTS AND SAMPLING

The study population for this TRaC was TG in Pattaya, Sattahip and Sriracha, aged 18-35. In order to be included in the study, TG must have: 1) self-identified as transgender and said that they feel sexually attracted to males; 2) had more than one sexual partners and had penetrative sex with these partners within the past three months; 3) been living in specific area for more than one months.

Respondents were recruited at time and place specify in sampling frame. Fieldworkers recruited all TG who appear in each place.

Inclusion and exclusion criteria were as follow;

Inclusion criteria	Exclusion criteria
<ul style="list-style-type: none">- Age 18-35- Define themselves as transgender- Attracted to male- had more than one sexual partner and had penetrative sex with these partners within the past three months- Live in specific area for more than 1 month	<ul style="list-style-type: none">- Being a Sisters staff or peer educator- Respondent is drunk or unable to control him/herself- Respondent not able to be interviewed within 2 hours of being sampled

Screening questions were used to assess eligibility for the study. Respondents who pass screening criteria were given self-administered questionnaire.

Time-location samplings (TLS) were used to recruit this hard-to-reach group. Every population member who appeared at the site during the fixed time interval were included in the sample. Mapped information on venues/locations for the TLS sampling frame was provided by staff at the 'Sisters' project drop-in center and verified by the PSI Thailand research. The locations listed below were all mapped locations to recruit TG to the study as follow;

	Location	Day	Time	No. of TGs Recruited
Pattaya				
1	Pattaya Walking street	Mon-Thr	10 pm – 12 am	194
2	Pattaya Soi 6	Mon-Thr	8 pm – 10 pm	52

⁴THE LANCET • Vol 359 • January 12, 2002 • www.thelancet.com

	Location	Day	Time	No. of TGs Recruited
3	SoiBua Kao	Mon-Thr	8 pm – 10 pm	43
4	Soi Na Klea 29	Mon-Thr	10 pm – 12 am	19
Sriracha				
1	SoiSrirachaNakorn 6	Fri-Sun	8 pm - 10 pm	11
2	Satang Pub	Fri-Sun	10 pm – 12 am	16
3	Nan Beauty Salon	Fri-Sun	10 pm – 12 am	5
4	Volleyball court	Sun	3 pm – 6 pm	6
5	Sriracha House Apartment	Fri-Sun	5 pm – 8 pm	9
Sattahip				
1	Bang Saray	Fri-Sun	11 pm – 1 am	2
2	Sumpatan Pub	Fri-Sun	11 pm – 1 am	2
3	SoiSukhumvit 43	Fri-Sun	9 pm – 11 pm	6
4	SoiSukhumvit 73	Fri-Sun	9 pm – 11 pm	9
5	KhunThep Wedding Studio	Fri-Sun	3 pm – 7 pm	12

A total of 308, 31 and 47 interviews were completed for Pattaya, Sattahip and Sriracharespectively. In total, 386 TG were recruited in this study.

2. DATA COLLECTION INSTRUMENTS

A structured questionnaire was used to collect data for identifying factors of behavior, monitoring logframe indicators and assessing program impact. This questionnaire included modules in the following areas: population characteristics, OAM factors of behavior, behavior, and exposure to Sisters interventions.

Questions about sexual behaviors were asked with four types of partners as follow;

- **“Commercial partner(s)”** means partner whom you give or are given money or other valuable thing in exchange with sex
- **“Regular Commercial partner(s)”** means partner whom you give or are given money or other valuable thing in exchange with sex more than one time
- **“Casual partner(s)”** means partner whom you have sex with but no emotional commitment, or feeling for, and not give or given money or other valuable thing in exchange with sex
- **“Regular partner(s)”** means partner whom you have sex with and have emotional commitment to, or feeling for

The questionnaires were translated into Thai and pre-tested by conducting approximately 10 interviews with TG in Silom area, Bangkok. These TG were excluded from participation in the actual study. The pre-test was used to check for understandability of questions and procedures for conducting interviews. It was also used to revise the questionnaire based on the following points: ease or difficulty of statement, comprehension, confidence in response, level of discomfort and social desirability.

3. DATA COLLECTION AND MANAGEMENT PROCEDURES

Data Collection

One field manager and five experienced fieldworkers were recruited from Bangkok. PSI/Thailand Research Team provided training to all of them. They attended two days

training. Field manager received an additional training to improve quality control of data collection.

All transgender women (as advised by peer educators) at the location during the sampling time period were approached by interview teams and peer educators assisted in TG screening process. Fieldworkers introduced themselves and recruited them to a study. Initial screening questions were asked. This was done away from other people at the venue, with only the interviewer and potential recruitee presented.

All those that were approached and which met the screening criteria were then read the informed consent script by interviewers. Participants were interviewed in a private place that maintains their confidentiality. On completion of the interview, the compensation payment of 250 Thai baht were paid to the respondent.

Data entry

Data entry process was done by fieldworkers. Dataset was cleaned and checked by PSI Data Analyst. Data quality steps included checking the questionnaire for internal consistency (in accordance with a scrutiny note), filter errors, appropriate coding for non-response or missing values, values that fall out of range, and other logical checks. The variable for each question included in further survey rounds remained consistent. The data was laid out in a rectangular format with one record signifying one respondent. A copy of cleaned data was made available in SPSS format.

4. DATA ANALYSIS

The segmentation tables were produced based on multiple logistic regression analyses. Explanatory variables which significantly contribute to the explanation of the variance in the behavior of interest (condom use and HIV test) were identified. Odds ratio of involvement in the behavior of interest were reported for each significant explanatory variable. Analysis of variance (UNIANOVA) was employed to estimate the adjusted means or proportions of each explanatory variable by the behavior of interest. Coarsened Exact Matching (CEM) was used to match treated individuals with those in a control group, based on specific covariates. The effect of treatment on outcome is the difference between treated and non-treated group.

5. HUMAN SUBJECTS PROTECTION

This study was approved by PSI Research Ethics Board (PSI REB) as in ANNEX B.

6. IMPROVEMENT FOR NEXT STUDY ROUND

During the next study round, there are several improvements to be applied to the study. First, questions about regular commercial partner should consider to be removed due to similarity to commercial partner. Second, before starting the fieldwork, permission letter should be prepared and submitted to some restricted area for ease of data collection. Appropriate time and venue for the interview should be considered i.e. 2-5 pm at beauty salon. Third, methodology should be improved to include TG who work in closed setting i.e. soldier camp. Fourth, increase the sample size for TG in Sattahip and Sriracha while considering their travel between Pattaya and these areas. Finally, data should also be recorded number and reason of TG who refuse to be included in this study.

MEMORANDUM

DATE: December 7, 2011
TO: Duangta Pawa
FROM: PSI Research Ethics Board
RE: REB Submission #52.2011
TITLE: Baseline HIV/AIDS TRaC Study among Transgenders in Pattaya, Sattahip and Sriracha, Thailand 2011

The PSI Research Ethics Board (PSI REB) has reviewed and approved the above referenced study via its expedited review process on December 6, 2011 for a period of 12 months. This approval will expire on December 5, 2012.

The IRB determined that study meets the criteria for expedited review under category, 45, CFR 46.110 Category 7 (*Research on individual or group characteristics or behavior (including, but not limited to, research on perception, cognition, motivation, identity, language, communication, cultural beliefs or practices, and social behavior) or research employing survey, interview, oral history, focus group, program evaluation, human factors evaluation, or quality assurance methodologies*).

The PI is required to inform the REB immediately of unanticipated problems or new information which could change the risk/benefit ratio. Modifications to study design, data collection tools, study forms, or PI staffing must be approved by the PSI REB prior to implementation. For more information concerning modification request or reporting unanticipated problems, please refer to the PSI/REB website (<http://www.psi.org/resources/research-ethics-board>) or contact Kelly O'Keefe (kokeefe@psi.org).

Sincerely,

Kelly O'Keefe
Research Ethics Board Coordinator
(202) 572-4515
